

FREEDOM, POWER, FLEXIBILITY: THE CLEARPATH MCP SOFTWARE SERIES PRODUCTS

HIGHLIGHTS

- *A complete, software-based version of the ClearPath Forward environment, deployable on Unisys systems, as well as industry-standard hardware and hypervisors*
- *The core ClearPath Forward attributes and defining characteristics are embedded in each deliverable*
- *Current product offerings span entry-level to mid-range workloads, application development and testing, demonstration environments, and academic uses – with more to come!*

Your Applications, Your Business

Success in the digital age means playing by a new set of rules. You have to be nimble and decisive. You have to capitalize on the latest trend at a moment's notice. And you have to constantly reimagine how you operate, so you can stay relevant no matter the competitive pressures.

Because of this, applications have become the new differentiator. Applications are immensely important to your organization, and keeping them current, available, and ready for use on a number of channels and devices is essential. It's how you'll keep enhancing your brand. And it's how you'll continue to bring more value to your business.

Making the Application Era Your Era

With the ClearPath® Software Series, you'll be able to participate in – and benefit from – this new “application era.” The ClearPath Software Series represents an evolutionary journey that will empower you to implement a full, software-based version of the ClearPath Forward™ environment on your preferred industry-standard hardware and hypervisors.

This way, you'll be able to seamlessly incorporate your applications into the rest of your infrastructure – be it a private or hybrid cloud, virtual environment, or software-defined data center – without foregoing the proven attributes you trust to run your business. And as a ClearPath MCP user, you'll have access to several Software Series deliverables that work together to help you redefine how you create, release, and manage your applications.

Powered by Software

Whether you deploy it in your data center, a hypervisor, in the cloud, or on a laptop, there's a ClearPath MCP Software Series product offering that's right for your business. Current deliverables include:

- **ClearPath MCP Gold:** A complete MCP operating environment built to support mid-level production workloads – including Unisys Agile Business Suite (AB Suite®) workloads – and offer unparalleled deployment and business model flexibility.
- **ClearPath MCP Bronze and Silver:** Entry-level environments designed for both general-purpose and AB Suite workloads, as well as specific business continuity and disaster recovery scenarios.

- **ClearPath MCP Developer Studio:** A full development platform, featuring the MCP Software Developer's Kit and most of the runtime software required to test new features slated for production deployment, including Unisys Enterprise Application Environment (EAE) and AB Suite. Unisys offers several editions of the ClearPath MCP Developer Studio software to best address your specific needs.
- **ClearPath MCP Developer Studio Personal Edition:** A portable version of Developer Studio designed for development, testing, and demonstration purposes.
- **ClearPath MCP Express:** A free download aimed at helping members of the academic community immerse themselves in the MCP development environment.

Your Operations, Redefined

When you use the ClearPath Software Series, you'll have the flexibility to define – and just as easily redefine – the way the ClearPath Forward environment supports and enables your organization's changing business and IT demands. With the freedom to choose how, when, and where you incorporate your MCP applications into the rest of your infrastructure, you'll find it easier to comply with your organization's hardware standards – all while you realize more value from the investments you've made in both technology and people.

And since the deliverables underpinning the ClearPath MCP Software Series sustain the ClearPath Forward environment's defining attributes – including multi-layered security, proven reliability, and high-transaction-volume processing – you'll smoothly transition to a software-based world. You won't even have to rebuild or recompile your applications to accommodate this shift.

This way, you'll become more adaptable, more agile, and better equipped to make sure your applications continue driving client satisfaction and competitive advantage.
