

YOUR DATA, TRANSFORMED: UNISYS BUSINESS INFORMATION SERVER

Navigating a Data-Defined World

Data moves through your business at an incredible rate. And as the amount you create, share, and store keeps growing, the ability to transform it into actionable intelligence will determine how well you're able to spot new opportunities and separate yourself from the competition.

With Unisys Business Information Server (BIS), you can turn your raw data into a valuable asset that helps your organization enhance its offerings, innovate faster, and better serve internal and external stakeholders alike. With it, you'll be able to create, organize, and manage your business logic, information, and web assets in an integrated environment everyone from developers to non-IT employees will find easy to use.

From Data to Intelligence

Though BIS includes numerous features – and offers just as many ways to put them to use – much of the BIS experience is defined by the following core functions:

- **Decision support:** With the ability to perform complex analyses, query databases, create graphs and charts, and easily structure and search your information, you'll be able to quickly extract critical insights from even the most complex datasets.
- **Application development:** With a robust, intuitive toolkit, you'll empower business users to create applications that leverage your data to serve a variety of needs.
- **Database access and data storage:** With native access to Relational Database Server (RDMS) for ClearPath® OS 2200, MySQL®, and Oracle®, as well as a familiar storage model, you'll make it easier to find the data you need.

With the help of these capabilities, you'll make faster, more accurate decisions – and empower your entire team to help the organization realize more value from its data.
